Adriana D. Blanco R.

AI Automation Specialist

AI enablement · n8n and LLMs · AI agents and MCP · Linux and Docker · Stripe and Web3 payments · UX/UI

Buenos Aires, Argentina (UTC-3) | Hybrid or on-site | veneland.ia.lab@gmail.com

GitHub: github.com/veneland | Portfolio: veneland.github.io/portafolio

Personal brand: Venecia · veneland (GitHub, portfolio and projects).

PROFESSIONAL SUMMARY

Automation and AI specialist who designs, builds and runs her own production systems, and helps others work better with AI. Comes from design: moved from UX/UI into AI automation and specialized there. Exploring automation and AI since 2022, running them in production since 2025, with 8+ years in digital product. Track record:

- automated the monitoring of 10 MetaTrader 5 accounts with n8n, PostgreSQL and Telegram;
- migrated a trading server between providers with verified backups and a phased cutover;
- built two MCP servers;
- orchestrates Claude Code, Codex and Antigravity in parallel;
- integrated live Stripe payments and Web3 wallet payments.

Works with AI-assisted development: specifies the business logic, defines validations and automated tests, and reviews results before they reach production. Brings security judgment (secrets, permissions, human approval) and clear interfaces for non-technical users. Enjoys sharing knowledge: builds skills and guides that help others use AI with judgment, with validation and verification stages. Also shares technology and AI content on YouTube and listens to users' problems to propose solutions.

CORE COMPETENCIES

AI enablement and coaching: custom skills for users, tips and best practices for Claude, Copilot and other tools, roadmaps with validation and verification stages to reduce hallucinations, judgment on when a process should move to n8n, documentation and mentoring for non-technical users.

Process automation: n8n (webhooks, schedules, Code nodes, conditional branching, REST API integrations), Telegram bots and alerts, scheduled reporting, heartbeat monitoring, approval workflows, digitization of manual processes.

Generative AI and agents: LLMs (Claude, GPT/Codex, Gemini, open-source models), Claude Code (subagents, skills, MCP, Remote Control), custom MCP servers, multi-agent orchestration with git worktrees, prompt and context engineering, AI output validation.

Development and integration: TypeScript, Next.js, React, Python, SQL, PostgreSQL, Firebase, Supabase, Stripe, Web3 payments, REST APIs, authentication (OAuth, TOTP 2FA).

Infrastructure and security: Linux VPS, Docker, Coolify/Traefik, systemd, Cloudflare, Vercel, backups and restore testing, secrets management (Infisical, Bitwarden, gitleaks), least privilege, human-in-the-loop.

Product and interfaces: UX/UI and Figma, dashboards and internal tools, process documentation (runbooks, step-by-step guides, master prompts).

PROFESSIONAL EXPERIENCE

WOS / Veneland — Independent automation, AI and digital product studio

Automation and AI Specialist (independent) **2022 – Present**

Designs, builds and operates systems for own products and clients, from idea to production, using AI agents for development, testing and documentation.

n8n automation and 24/7 infrastructure

- Automated the monitoring of 10 MetaTrader 5 accounts with an EA → n8n webhook → PostgreSQL → Telegram pipeline. It runs 4 workflows: event ingestion, daily summary, weekly report and a heartbeat that alerts on silent accounts, with messages organized in per-account threads.
- Built 12 distinct n8n workflows, including:
  - MT5 signal ingestion with validations (17 nodes);
  - automatic onboarding of premium users to private Telegram channels, logged in Firestore;
  - scheduled weekly reports.
- Developed a Next.js dashboard with Google OAuth and TOTP 2FA on PostgreSQL (about 2.4 million telemetry records), deployed with Docker and Coolify.
- Migrated the trading server from Hetzner to Contabo: Coolify/Traefik, PostgreSQL, n8n and 10 headless MT5 instances (Wine, Xvfb, systemd). The migration included checksum-verified backups, restore tests, a phased DNS cutover and Go/No-Go decisions documented across 184 reports.

Risko — Trading and investment tools ecosystem

- Built Logicore, Risko Capital's automated investment platform:
  - crypto: Pionex grid bots and Binance data;
  - futures and forex: MT5 and NinjaTrader Expert Advisors;
  - stack: Python collector → PostgreSQL 16 → Next.js 16 dashboard, deployed with Docker and Coolify;
  - 91 commits in two weeks.

- Built a Python backtesting engine (about 25 modules, 189 automated tests) that evaluated 2,536 variants of 10 strategies with out-of-sample validation.
- Orchestrated Claude Code, Codex and Antigravity in parallel with git worktrees: 8 specialized subagents, 12 custom skills and a 17-task board (12 merged). Human approval is required for commits and exchange operations.
- Keep risko.app products online:
  - Safer: protection EA with a sales site (login and Web3 wallet payments) plus a license generator with TOTP and QR;
  - Lot Size: a React and Firebase PWA;
  - Pulse: a signals platform with a Web3 wallet payment flow (Privy, ethers, on-chain verification);
  - a backtest dashboard.

AI, agents and Model Context Protocol (MCP)

- Built a Python MCP server for MetaTrader 5 that compiles EAs and runs, compares and analyzes backtests. It exposes 8 tools, has a security module that blocks real orders, 20 tests and 78 logged runs.
- Built a TickTick MCP server in TypeScript with OAuth 2.0 and 15 tools.
- Designed a shared memory for AI agents on Obsidian and git. It consolidates 150+ conversations from 5 AI platforms, has Python validators and tests, and its MCP contract allows only a human to accept changes.
- Implementing a 24/7 agent environment on a second VPS, with security rules for agents: blocked destructive commands and credential paths, development-only environments, and secrets managed with Infisical.

AI working method and enablement

- Designed an AI working method (VOS Method) with validation and verification stages, test banks and human approval at every gate, to reduce hallucinations and errors. Documented it in guides, master prompts and agent rules (AGENTS.md) that anyone can follow.
- Build custom skills that standardize recurring AI tasks (12 skills in Logicore, covering market analysis, backtesting and EA validation, among others) and document how to use them so others can adopt them.
- Share AI and automation tools on my YouTube channel, focused on applying them to real projects.

Custom applications for clients

- el_espacio (elespaciolugar.com): editorial and education platform for a publisher and literature teacher in Spain.
  - Stack: Next.js 15, React 19, TypeScript and Firebase.
  - Google login, enrollment flow, and student and admin dashboards.
  - Live Stripe payments: Checkout, signature-verified webhook and end-to-end tests.
  - 85 commits over phased iterations with the client.

Product Design, Branding and UX/UI

Designer for agencies and brands **8+ years**

Signal TV, Grafico Panamá, Quantic Brands, Kiwi Agency, Talk Media Group, Recovery+, Gnomio Studios

- Designed brand systems, web interfaces and digital assets for campaigns and digital channels with marketing teams and non-technical clients. This is the foundation of the UX/UI approach I now apply to dashboards and internal tools.

EDUCATION

- **Graphic Design** — Instituto Universitario Rodolfo Loero Arismendi (IUTIRLA), Venezuela. Tertiary program, completed through the 9th semester.
- **Integral Offset Operator** — Centro de Formación Integral en Artes Gráficas (CEFIAG), Venezuela. Tertiary program, graduated.
- **Sociology** — Universidad Central de Venezuela (UCV). University program, completed through the 6th semester.
- **Continuing education (2022 – present):** AI automation, agents and LLMs, web development, UX/UI, Linux infrastructure, public speaking and management. Certificates available on request.

TECHNICAL SKILLS

Generative AI: Anthropic Claude (Claude Code, subagents, skills, MCP), OpenAI (ChatGPT, Codex CLI), Google Gemini and Antigravity, OpenCode, Ollama, LM Studio, OpenRouter, Cursor, GitHub Copilot, NotebookLM, MCP SDK (TypeScript and Python).

Automation: n8n, webhooks, REST APIs, Telegram Bot API, Resend, cron, systemd; Microsoft Power Platform (Power Apps, Power Automate, Power BI): beginner, currently training.

Languages (AI-assisted development): TypeScript, Python, SQL, MQL5, HTML/CSS; basic: C# (NinjaTrader), Kotlin (Android).

Frameworks and data: Next.js, React, Vite, Tailwind CSS, PostgreSQL, Firebase/Firestore, Supabase, pytest, Vitest, Playwright.

Infrastructure: Ubuntu Linux, Docker, Coolify, Traefik, Wine/Xvfb, Cloudflare, Vercel, Tailscale, Git/GitHub, Infisical, Bitwarden, gitleaks.

Payments and finance: Stripe, Privy, ethers.js, MetaTrader 5, NinjaTrader, Pionex and Binance APIs, backtesting, risk management.

Languages: Spanish (native); English (intermediate).
